

## Properties of Ionic and Covalent Compounds

Remember...properties of metals are a result of the characteristics of metallic bonds.

What are the properties of covalent compounds?

## Properties of Covalent Compounds

- Can be any state of matter (solid, liquid, gas)
- Lower melting points
- Don't conduct electricity
- Low solubility (some)

What are the properties of ionic compounds?

## Properties of Ionic Compounds

- Crystalline solids-crystal lattice
- Solids at room temperature
- High melting point
- Hard, brittle
- Conducts electricity when in liquid state or when dissolved in water
- High solubility

Copper sulfate

[http://en.wikipedia.org/wiki/Salt\\_%28chemistry%29](http://en.wikipedia.org/wiki/Salt_%28chemistry%29)

NaCl (Sodium Chloride)

## Ionic compounds conduct electricity

- For a material to conduct an electric current, there must be charged particles that can move.
- Ionic compounds in a liquid state or dissolved in water can conduct electricity
  - > Ions are free to move
- An aqueous solution of an ionic compound that conducts electricity is called an **electrolyte**.

## Ionic bonds are very strong

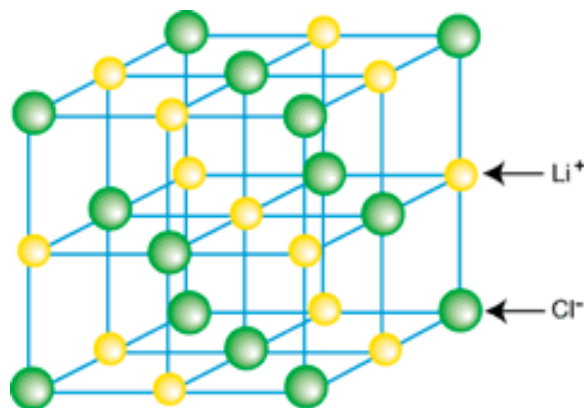

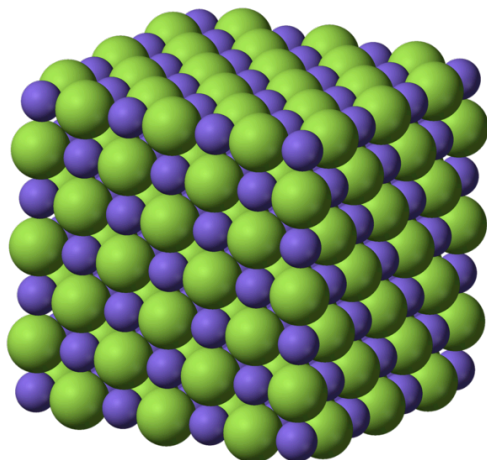

- Ionic bonds are very strong so lots of energy is needed to break them apart.
- Therefore, ionic compounds have very high melting points and boiling points.

Compound	Melting Point (°C)	Boiling Point (°C)
NaI	660	1304
KBr	734	1435
NaBr	747	1390
CaCl <sub>2</sub>	782	>1600
NaCl	801	1413
MgO	2852	3600

## Crystal Lattice

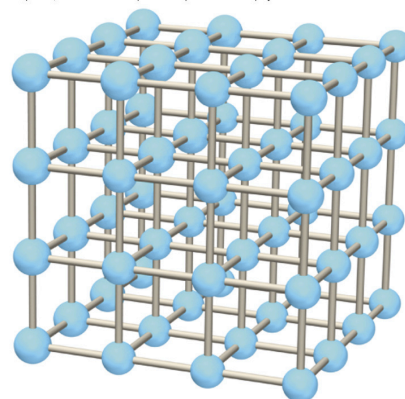

- Ionic Compounds form crystals.
- Positive and negative ions are packed into a regular, repeating pattern that balances the attraction and repulsion between ions.
  - > Positive and negative ions are attracted to each other, repelled by same charge
- This results in a **crystal lattice**: a 3-dimensional geometric arrangement of particles.
  - > Each positive ion is surrounded by negative ions
  - > Each negative ion is surrounded by positive ions

Simple cubic  
 $a = b = c$   
 $\alpha = \beta = \gamma = 90^\circ$

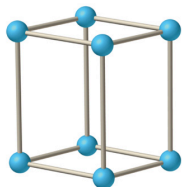

Tetragonal  
 $a = b \neq c$   
 $\alpha = \beta = \gamma = 90^\circ$

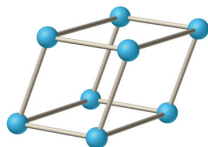

Orthorhombic  
 $a \neq b \neq c$   
 $\alpha = \beta = \gamma = 90^\circ$

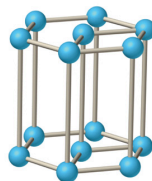

Rhombohedral  
 $a = b = c$   
 $\alpha = \beta = \gamma \neq 90^\circ$

Monoclinic  
 $a \neq b \neq c$   
 $\gamma \neq \alpha = \beta = 90^\circ$

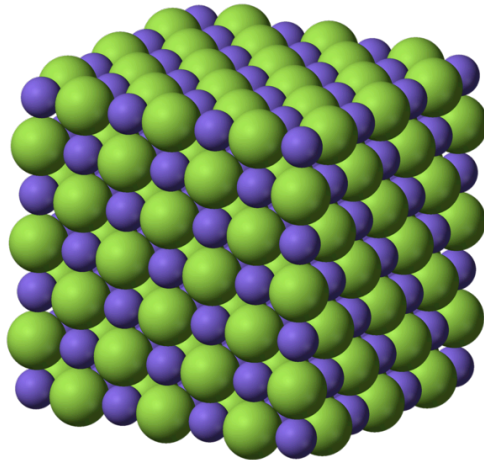

Triclinic  
 $a \neq b \neq c$   
 $\alpha \neq \beta \neq \gamma \neq 90^\circ$

Hexagonal  
 $a = b \neq c$   
 $\alpha = \beta = 90^\circ, \gamma = 120^\circ$

When an external force is applied to a crystal (you hit it with a hammer), it causes the crystal to crack

- The force repositions the like-charged particles next to each other
- Repulsive force cracks crystal

## Energy of ionic bonds

- **Lattice energy:** energy needed to break apart one mole of an ionic compound.
  - > The greater lattice energy is, the stronger the force of attraction
- Lattice energy is greater for small ions, and greater charges (remember Coulomb's law?)

## Remember periodic trends: **ionic radius**.

- Cations are always smaller than their neutral atom
- Anions are always bigger than their neutral atom
- Moving down a group: ionic radii increases
- Moving across a period: ionic radii of cations decreases, ionic radii of anions decreases

Atomic/Ionic Radii			Atomic/Ionic Radii		
5A	6A	7A	1A	2A	3A
 0.70  1.71	 0.66  1.40  1.04  1.84  1.17  1.98  1.37  2.21	 0.64  1.36  0.99  1.81  1.14  1.85  1.33  2.16	 1.52  0.60  1.86  0.95  2.31  1.33  2.44  1.48	 1.11  0.31  1.60  0.65  1.97  0.99  2.15  1.13	 1.43  0.50  1.22  0.62  1.62  0.81

Example 1: Which of the following has a greater lattice energy?

NaCl or LiCl? Why?

KF or KCl? Why?

MgCl<sub>2</sub> or NaCl? Why?

### Lattice Energies for Some Ionic Compounds

Compound	Lattice Energy (kJ/mol)	Compound	Lattice Energy (kJ/mol)
LiF	1030	MgCl <sub>2</sub>	2326
LiCl	834	SrCl <sub>2</sub>	2127
LiI	730		
NaF	910	MgO	3795
NaCl	788	CaO	3414
NaBr	732	SrO	3217
NaI	682		
KF	808	ScN	7547
KCl	701		
KBr	671		
CsCl	657		
CsI	600		

## Example 2

Which compound has greater lattice energy? Why?

- KI or KBr?                       $\text{SrCl}_2$  or  $\text{AgCl}$ ?

Order the following compounds from lowest to highest melting point.

- KI, KCl, KBr, KF
